Exercise N.6

Exercise

In a bidimensional Hilbert space, \mathbf{e}_1 and \mathbf{e}_2 form an orthonormal basis.

- Consider the system of the two vectors $\mathbf{a}_1 \equiv \mathbf{e}_1 + i \, \mathbf{e}_2$ and $\mathbf{a}_2 \equiv i \, \mathbf{e}_1 - \mathbf{e}_2$. Do \mathbf{a}_1 and \mathbf{a}_2 form a basis ? Explain.
- Show that

$$\mathbf{f}_1 = \frac{1}{\sqrt{2}}(\mathbf{e}_1 + \mathbf{e}_2); \quad \mathbf{f}_2 = \frac{1}{\sqrt{2}}(\mathbf{e}_1 - \mathbf{e}_2)$$

form an orthonormal basis.

• Write the 2 \times 2 matrix **A** that allow to express the vectors \mathbf{f}_i in terms of the vectors e_j , i.e. $f_i = A_{ji}e_j$; i, j = 1, 2.

• We have seen that, in a basis $\{\mathbf{e}_j\}$, the linear operator \hat{Q} is completely determined by the square matrix $Q_{kj} \equiv \langle \mathbf{e}_k | \hat{Q} \mathbf{e}_j \rangle$ such that

$$\hat{Q}\mathbf{e}_j = Q_{kj}\mathbf{e}_k$$

2 To every linear operator \hat{Q} we can associate its **adjoint** \hat{Q}^{\dagger} by the following definition

 $\forall \mathbf{a}, \mathbf{b} \in \mathcal{H} :< \mathbf{a} | \hat{Q}^{\dagger} \mathbf{b} > \equiv < \hat{Q} \mathbf{a} | \mathbf{b} >$

3 The matrix $(Q^{\dagger})_{kj}$, describing the operator \hat{Q}^{\dagger} in the basis $\{\mathbf{e}_{j}\}$, by definition, is given by

 $\widehat{Q}^{\dagger} \mathbf{e}_j \equiv (Q^{\dagger})_{kj} \, \mathbf{e}_k, \quad with \quad (Q^{\dagger})_{kj} = < \mathbf{e}_k |\widehat{Q}^{\dagger} \mathbf{e}_j >$

QUANTUM MECHANICS Lecture 18

• We have seen that, in a basis $\{\mathbf{e}_j\}$, the linear operator \hat{Q} is completely determined by the square matrix $Q_{kj} \equiv \langle \mathbf{e}_k | \hat{Q} \mathbf{e}_j \rangle$ such that

$$\hat{Q}\mathbf{e}_j = Q_{kj}\mathbf{e}_k$$

2 To every linear operator \hat{Q} we can associate its adjoint \hat{Q}^{\dagger} by the following definition

$$orall \mathbf{a}, \ \mathbf{b} \in \mathcal{H} : < \mathbf{a} | \hat{Q}^{\dagger} \ \mathbf{b} > \equiv < \hat{Q} \mathbf{a} | \mathbf{b} > \mathbf{c}$$

Solution The matrix $(Q^{\dagger})_{kj}$, describing the operator \hat{Q}^{\dagger} in the basis $\{\mathbf{e}_j\}$, by definition, is given by

$$\hat{Q}^{\dagger} \mathbf{e}_{j} \equiv (Q^{\dagger})_{kj} \, \mathbf{e}_{k}, \hspace{0.3cm} with \hspace{0.3cm} (Q^{\dagger})_{kj} = <\mathbf{e}_{k} |\hat{Q}^{\dagger} \mathbf{e}_{j}>$$

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ト ・ ヨ

QUANTUM MECHANICS Lecture 18

MECHANICS Lecture 18

Enrico Iacopini

However, according to the definition of adjoint operator, one has

$$(Q^{\dagger})_{kj} = \langle \mathbf{e}_k | \hat{Q}^{\dagger} \mathbf{e}_j \rangle = \langle \hat{Q} \mathbf{e}_k | \mathbf{e}_j \rangle =$$

= $\langle Q_{nk} \mathbf{e}_n | \mathbf{e}_j \rangle = Q_{nk}^* \langle \mathbf{e}_n | \mathbf{e}_j \rangle = Q_{jk}^* =$
= $(Q^{\dagger})_{kj}$

2 Therefore, the matrix representing the operator \hat{Q}^{\dagger} in the orthonormal basis $\{e_j\}$ is the hermitian conjugate of the matrix which represents, in the same basis, the operator \hat{Q} .

< ロ > < 同 > < 三 > < 三 > <

QUANTUM MECHANICS Lecture 18

Enrico Iacopini

However, according to the definition of adjoint operator, one has

$$(Q^{\dagger})_{kj} = \langle \mathbf{e}_k | \hat{Q}^{\dagger} \mathbf{e}_j \rangle = \langle \hat{Q} \mathbf{e}_k | \mathbf{e}_j \rangle =$$

= $\langle Q_{nk} \mathbf{e}_n | \mathbf{e}_j \rangle = Q_{nk}^* \langle \mathbf{e}_n | \mathbf{e}_j \rangle = Q_{jk}^* =$
= $(Q^{+})_{kj}$

2 Therefore, the matrix representing the operator \hat{Q}^{\dagger} in the orthonormal basis $\{\mathbf{e}_{j}\}$ is the hermitian conjugate of the matrix which represents, in the same basis, the operator \hat{Q} .

But every physical observable Q must have an expectation value on any physical state which is real...

Enrico Iacopini

QUANTUM MECHANICS Lecture 18

Hermitian operators and physical observables

Since the condition of having a real expectation value on any vector is a sufficient condition to conclude that the operator is hermitian,

we can affirm that the physical observables must be represented by hermitian operators.

Enrico Iacopini

Hermitian operators and physical observables

This is the reason why every physical observable $\hat{Q} = \hat{Q}(x, -i\hbar\frac{\partial}{\partial x})$, acting on the wave-functions, is such that

$$\langle \Psi_1 | \hat{Q} \Psi_2 \rangle \equiv \int dx \, \Psi_1^*(x,t) \left(\hat{Q} \Psi_2 \right)(x,t) =$$
$$= \int dx \, \left(\hat{Q} \Psi_1^* \right)(x,t) \, \Psi_2(x,t) \equiv \langle \hat{Q} \Psi_1 | \Psi_2 \rangle$$

• But since there is only one possible outcome from the measurement, the standard deviation of the probability distribution defined by $|\Psi_q|^2$ is equal to zero:

$$\sigma_q^2 = < \mathbf{\Psi}_q | \left(\hat{Q} - < Q > \right)^2 \mathbf{\Psi}_q > = 0$$

e However, Q̂ is hermitian and the same is true for Q̂− < Q >≡ Q̂ − q since q is real, therefore

$$0 = \langle \Psi_q | (\hat{Q} - q)^2 \Psi_q \rangle = \langle (\hat{Q} - q) \Psi_q | (\hat{Q} - q) \Psi_q \rangle =$$

= || $(\hat{Q} - q) \Psi_q ||^2$

and the only possibility is that

$$(\hat{Q} - q) \Psi_q = \mathbf{0} \iff \hat{Q} \Psi_q = q \Psi_q$$

Enrico Iacopini

QUANTUM IECHANICS Lecture 18

Lecture 18

Enrico Iacopini

The equation

$$\hat{Q} \Psi_q = q \Psi_q$$
 with $\Psi_q \neq 0$

is called the <u>eigenvalue equation</u> for the operator \hat{Q} and Ψ_q is an eigenfunction (eigenvector) of \hat{Q} , corresponding to the eigenvalue q.

Enrico Iacopini

Now, be very careful.

A frequent mistake is to think that, when you measure a physical observable Q on a physical state described by the (normalized) vector Ψ, the vector originated after the measurement is QΨ.

This is false !

Enrico Iacopini

Lecture 18

Enrico Iacopini

If and only if Ψ is an eigenvector of the operator \hat{Q} for some eigenvalue q, we have

$$\hat{Q}\Psi = q\Psi$$

But, also in this case, it is not true that the vector describing the physical state after the measurement of \hat{Q} is $q \Psi$, but it remains Ψ .

3

Let us observe, now, that

- If Ψ is an eigenvector of \hat{Q} for the eigenvalue q, then also $\alpha \Psi$ (with $\alpha \neq 0$...) has the same property.
- It may happen that, for a given eigenvalue q, there are two or more linearly independent eigenvectors.
- In this case, any linear combination of these eigenvectors is an eigenvector of Q for the eigenvalue q and we say that the eigenvalue q is degenerate.
- The set of all the eigenvalues of the hermitian operator Q is its spectrum.

Before entering in more general details, let us recall some conclusions that we have already drawn concerning the solution of an "ante-litteram" eigenvalue problem, the time-independent Schrödinger equation

$$\hat{H}\Psi = E \Psi$$

where

- \hat{H} is the hamiltonian operator;
- E the energy eigenvalue;
- ψ the corresponding eigenvector (eigenfunction).

In the case, for instance, of the **harmonic oscillator**, the energy spectrum is

$$\left\{ E_n = \left(n + rac{1}{2}
ight)\hbar\omega; \ n = 0, 1,
ight\}$$

The corresponding normalized eigenfunctions are

$$\psi_n(x) = \left(rac{m\omega}{\hbar\pi}
ight)^{rac{1}{4}} rac{1}{\sqrt{2^n\,n!}} e^{-rac{1}{2}rac{m\omega}{\hbar}\,x^2} \; H_n\left(x\sqrt{rac{m\omega}{\hbar}}
ight)$$

and the eigenvalues are non-degenerate.

ight)$$

and the eigenvalues are non-degenerate.

3

As another example, we can consider the hamiltonian associated to the infinite square well between 0 and +a.
 In this case, the spectrum of is

$$\left\{E_n=\frac{\hbar^2}{2m}\left(\frac{n\pi}{a}\right)^2; \ n=1, 2, \dots\right\}$$

2 The normalized eigenfunctions are

$$\psi_n(x) = \sqrt{\frac{2}{a}} \sin\left(\frac{n\pi x}{a}\right)$$

and the eigenvalues are still non-degenerate.

QUANTUM MECHANICS Lecture 18

Still about the eigenvectors of a hermitian operator

In general, we can conclude that the determinate states of any observable Q are described by the eigenvectors of the hermitian operator Q representing that particular observable.

But, as we will see in the next lecture, the opposite is not always true ! Enrico Iacopini
